Appendix 1: Tree Reference Plans

Appendix 2: Detailed Tree Assessment

1.0 Introduction

Gavin Jones was commissioned to carry out a tree survey on behalf of First Port at Langley Park as per quotation MS17-079. The survey was completed by Carlo Vannini on behalf Gavin Jones in relation to tree health and management recommendations, safety to the general public, and outlining any proposed remedial works. The site visit was carried out on the 29th-31st of January 2nd, 5th-7th, 9th, 12th & 13th of February 2018 with only an inspection of trees being carried out from ground level.

2.0 The Site

2.1 Description of the site

Langley Park is a private residential estate, the site benefit from two large open green spaces to the east and to the north-west both of which profit from an artificial lake. The overall aesthetics of the site appears tidy and well maintained.

2.2 Weather conditions

The weather conditions during the site visit were dry on most days except for two days with heavy rain.

3.0 The Trees

3.1 Unless expressed otherwise 1) information contained within this report covers only those items that were examined and reflects the condition of those items at the times of inspection; and 2) the inspection is limited to visual examination of accessible items. There is no warranty or guarantee, expressed or implied, that problems or deficiencies of the plant or property in question may not arise in the future.

3.2 Trees are living organisms whose health and condition can change rapidly, the health, condition, and safety of trees should be checked on a regular basis, preferably at least once in an 18 month period. The conclusions and recommendations in this report are only valid

for a period of 18 months from the date of this report. This period of validity may be reduced in the case of any change in conditions to or in proximity to the tree.

3.3 The trees have been assessed from ground level. All information was collected by carrying out a Visual Tree Assessment (VTA). The trees were not tagged during the survey. However, accurate plotting of the trees has resulted in them being easily identifiable from the tree reference plan (Appendix 1).

3.4 Trees Surveyed

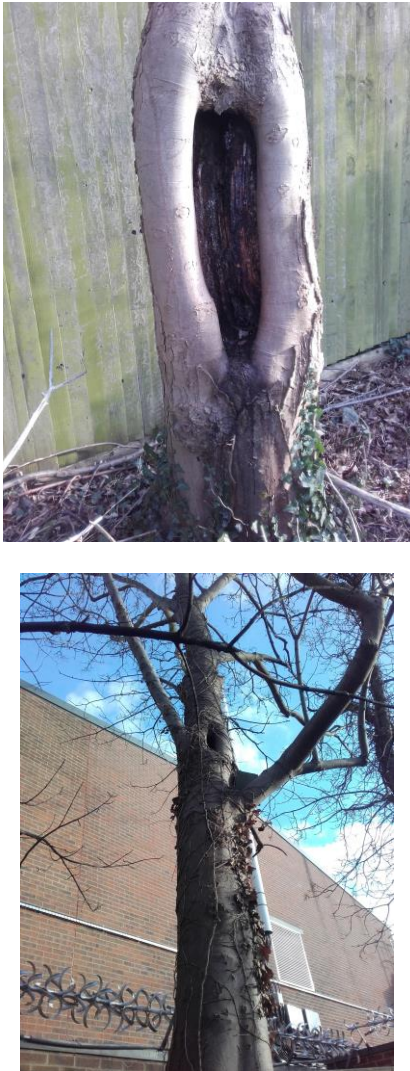

During the survey a total of 508 individual trees and 15 groups of trees were inspected and recorded as part of a detailed tree condition survey within the inspected area. Please note that the woodland and park area to the north-east of the estate was inspected as part of a tree risk assessment, meaning that only trees needed remedial work were plotted on the electronic map.

Langley Park has a good variety of tree species of different maturity. Some of the species include common oak (*Quercus robur*), common lime (*Tilia sycamores*), sycamore (*Acer pseudoplatanus*), holly (*Ilex aquifolium*), ash (*Fraxinus excelsior*), birch (*Betula pendula*), elm (*Ulmus procera*), horse chestnut (*Aesculus hippocastanum*), sweet chestnut (*Castanea sativa*), London plane (*Platanus x hispanica*), Turkey oak (*Quercus cerris*), cedar (*Cedrus atlantica*), scots pine (*Pinus sylvestris*), leyland cypress (*X Cupressocyparis leylandii*), thuja (*Thuja plicata*).

With regards of the structural condition of the trees at Langley Park it was noticed that some trees have had structural defects for a number of years in terms of stem cavities either at the base of the tree or further up the stem, further to this some trees were found to be dead. Some of these trees include T49 a semi-mature sycamore (see figure1 & 2) which has sustained a large stem wound which has evolved into a large cavity in addition the tree has a second cavity at approximately 8m also within the main stem. Although the tree is still safe at this time we should consider that the strength of the stem has been considerably reduced by the defects. T108 a mature horse chestnut looks in good health in terms of vitality when observed from the distance however, after a more in-depth investigation by removing the ivy around the stem the tree was found to be infected by *Phytophthora* or commonly known as bleeding canker which very often is related to *Aesculus hippocastanum* trees, in addition to the latter part of the lower stem is also decayed with visible signs of soft white rot which suggest a second fungal pathogen has also infected the stem. T98 a semi-mature lime has

been pollarded to 2m, the main stem is totally decayed and beginning to break apart (See figure 3). T518 a mature lime growing within the woodland area to the Northeast is infected with *Kretzschmaria deusta* a rather aggressive fungal infection often associated with lime trees. Its strategy is to initially colonise the roots system moving up the lower stem at later stage, the lime adjacent to T518 has already died possibly by the same fungal infection although no signs of fruiting body were visible during the inspection. All of the trees mentioned above have been listed to be removed on safety issues

All recommendation here mentioned can be found in the detailed tree assessment and relevant action plans provided.

Photograph	Description
	<p>Figure 1 & 2: Showing T49 a semi-mature sycamore suffering from a large cavity within the lower stem and a secondary smaller cavity approximately 8m from ground level.</p>

Photograph	Description
	<p>Figure 3: Showing T98 a semi-mature lime with major stem defects, hollowing, decay and beginning to break apart.</p>

Photograph	Description
	<p>Figure 4: Showing T100 close to T98, the tree is being dead for a year or so judging from the size of the re-growth compared with the remaining of the lime growing in the same area.</p>

Photograph	Description
	<p>Figure 5 & 6: Showing T325 a mature <i>Morus nigra</i>, the stem covered in ivy has two cavities which have been filled with cement. This practise of treating a tree cavity like a tooth has been abolished for number of years, this is because the cement prevents the tree from compartmentalise in other words to seat the cavity by producing new wood commonly known as “reaction wood”. This should be avoided at all cost within any trees in any circumstance.</p>

Photograph	Description
	<p>Figure 7: Showing T330 an over-mature <i>Castanea sativa</i>, the tree has high value in terms of habitat within the cavities in upper stem and despite its current form of being dramatically reduced in height and spread this tree should be kept in the current form for as long as possible. Any removal of the upper stem should be backed up by a bat survey.</p>

3.5 Height, Stem Diameter and Crown Spread

Height and crown spread are given in meters (m) and stem diameter in millimetres (mm). All dimensions are estimated.

3.6 Root and Stem Decay Pathogens and Structural Defects

It is to be taken that unless otherwise stated with each individual entry, there were no external signs that root and stem decay pathogens or serious structural defects, present at the time of inspection.

3.7 Bat Potential

Trees were scored as having Potential for bats as follows; '**Yes**', '**No**', '**Unknown**'. For use by bats, roosting or otherwise. The assessment required the exercise of judgment, but the general guidelines set out below were followed:

- 'No' - Trees were;
 - Not sufficiently mature to have developed potential bat roost features, or trees that were sufficiently mature but were seen to lack such features following careful survey.

- **'Unknown' Trees were;**
 - No potential roost features were identified, which could not be examined completely and were of sufficient maturity to support such features in locations not visible from the ground or where such features appeared to be extremely limited, offering minimal roosting potential.
 - Trees exhibiting only poorly-developed potential roost features or only one type of well-developed potential roost feature in a very limited range of locations or orientations
- **'Yes' Trees were;**
 - Exhibiting at least one roost feature that showed probable evidence of past use by bats.
 - Showing one type of well-developed potential roost feature in a wide range of locations or orientations.
 - Showing several types of well-developed potential roost features.

Trees that were obviously too immature to provide bat roost features were not investigated in any detail and no individual assessments of them are presented.

3.8 Maintenance Work Recommendations

All recommendations can be found in the detailed tree assessment provided (Appendix 2).

All tree work will be carried out in accordance with BS3998 2010, industry best practice.

The chosen Tree Surgeon Company shall ideally be chosen from The Arboricultural Association's Approved Contractor list.

The statutory protection will be adhered to (Wildlife and Countryside Act, 1981) (Countryside and Rights of Way Act, 2000). If further advice is required, particularly if bats are discovered during tree work, it will be obtained from Natural England or other competent person and recommendation adhered to.

3.9 Monitoring

It is recommended that the trees be resurveyed within 18 months from the date of the site visit. As a tree grows and environmental conditions alter and change, the monitoring of the tree stock is essential.

4.0 Other Supporting Information

4.1 Insurance Details

Gavin Jones Ltd is insured by RSA Insurance for professional indemnity including legal liability for professional services to a value of £10,000,000 for any one claim.

4.5 Qualification, experience and professional membership: Carlo Vannini

Carlo holds a level 2 RFS (Royal Forestry Society) certificate and the level 4 professional diploma in Arboriculture and is a member of the Arboriculture Association. Carlo has worked within the industry for eleven years, where he has gathered extensive experience and knowledge both in the commercial and domestic tree work.

5.0 Glossary

5.1 Defining Age Class - Maturity

Newly planted: planted since last annual survey.

Young: <20% of final life expectancy for species.

Semi-mature: >20-70% of final life expectancy for species.

Mature: >70%-99% of final life expectancy for species.

Veteran: >70%-99% of final life expectancy for species.

5.2 Defining Overall Condition – General health of the tree

Good: Full functionality showing average vitality i.e. normal bud growth, leaf size, crown density.

Fair: Fully functionality showing below average vitality i.e. reduced bud growth, small leaf size, lower crown density.

Poor: Limited functionality showing significant below average vitality i.e. limited bud growth, small and chlorotic leaves

5.3 Defining Tree Works

Deadwood removal: this means removal of all deadwood from the tree canopy categorized as Major deadwood = 25 mm diameter or above and Minor Deadwood = up to 25 mm diameter unless otherwise stated. Cuts will be made to the nearest appropriate pruning position.

Crown cleaning: this is a health and safety trim to remove deadwood (as specified above), diseased and dying wood, broken or split branches and crossing or rubbing branches.

Raise low canopy: removal of the lowest branches which effectively increases the height of the main crown above ground level. All the remaining branches will normally be above the height specified in meters.

Crown reduction: this means a reduction of the crown size in all directions to leave a balanced branch structure. It is a complete crown treatment and not just a reduction in height without dealing with side branches. It is normally specified as a meterage and refers to the branch proportion to be removed in relation to the total branch length from tip to trunk.

5.4 Defining other Terms Used

Compression fork: union with enclose bark, which acts mechanically like a crack.

Tensile fork: union optimized for the bending of the stems away from each other. There is no included bark which would have the nature of a crack.

Occlusion: The continued radial growth of new wood, including wound wood, which gradually grows over wounds to the woody parts of trees.

Wound wood: In woody stems, the new wood developing in response to a wound, often resulting in a swelling which gradually occludes the wound.

7.0 Revision & Review Record

Rev	Date	Amendment	Creator	Checked
01	20/02/2018	Minor amendments	CV	MDA

8.0 Disclaimers

- 8.1 This tree condition survey has been undertaken by visual inspection from ground level at Langley Park in order to individually assess all trees under the jurisdiction of First Port. These are purely visual assessments of these trees.
- 8.2 No technical survey equipment was utilised, in order to carry out the assessments except a diameter tape, hypsometer, mallet and probe. The same methodology was applied to all the trees (i.e. an assessment was made starting at the base of each tree and moving up the stem into the crown, along with an assessment of the canopy being made via viewing the tree at distance and from underneath the canopy).
- 8.3 All assessments were carried out from ground level. Decay detection tests have not been undertaken as this fell outside the scope of this report.
- 8.4 This report, based on the survey, contains a suggested timescale for remedial works to be undertaken from the date of the survey at Langley Park. In the expert opinion of the author these times scales should be adhered to.
- 8.5 Care has been taken to obtain all information from reliable sources. All data has been verified insofar as possible; however, the surveyor can neither guarantee nor be responsible for the accuracy of information provided by others.
- 8.6 This report is for the sole use of the above named client and refers to only those trees identified within; alteration or use by any other(s) in attempting to apply its contents for any other purpose renders the report null and void.

- 8.7 Any legal description provided to the consultant is assumed to be correct. Any titles and ownership to any property are assumed to be good and marketable. No responsibility is assumed in character.
- 8.8 Possession of this report or a copy thereof does not imply right of publication or use for any purpose by any other person to whom it is addressed, without prior expressed written or verbal consent of the consultant.
- 8.9 The local planning authority (LPA) have not been contacted to determine whether any Tree Preservation Order (TPO) covers the tree, nor to determine if the site is a Conservation Area. Before undertaking any work to the tree, it would be advisable to check whether either of these planning controls are in operation; if they are, it would be necessary to obtain consent (or in case of a Conservation Area give six weeks' notice of intent) before undertaking any such work.

9.0 Declaration

I hereby confirm that this tree survey and report was undertaken and completed by,

Carlo Vannini Dip. Arb (RFS)

Employed by: Gavin Jones Group.

General Tree Assessment (Detailed)

Tree ID: 308	A Group --	Tag: TPO: Tree Comment: Survey Comment: Group of young trees made up for the majority of hazel with the occasional pine, oak, birch and horse chestnut. Not all tree stems close to the boundary were inspected due to dense undergrowth, although the canopies appeared to be of good vitality. All hazel can be coppiced periodically every 4-5 years to keep the growth under control.	Assessor: Carlo Vannini Date: 07-Feb-18
